ISMLA 17/18: Web Frontend Exercises

Give the job application interface a professionally-looking frontend with the help of frontend libraries.

1. Add the Bootstrap and Font Awesome libraries to your project (see slides).

2. Add input validation to the form elements. Specific feedback should be given via alert classes at the top/bottom of the page (missing/invalid input, successful application).

3. Add styles to the button(s).

4. Where it makes sense, add icons for easier interpretability.

5. Think about how you could improve the layout further and give your application a professional look.
